3. **UK Policy, Regulation, Strategy and Markets**
  - I. Flexibility Strategy
  - II. Technology Strategy
  - III. Approach to Energy Bills
  - IV. Future Flexibility Market

## **Appendix: Abbreviations**

# 1

## Introduction

Document purpose, contents, scope,  
usage, update process and timeline

# Context and Purpose: What is this Horizon Scan and why is it needed?

This Horizon Scan is a tracker of projects, policies, market design and regulation relevant to Equinox

Equinox will unfold to a backdrop of **three years of policy and regulatory change** regarding many areas **relevant to project delivery** like flexibility market design and heat pump roll out

As a **condition of Ofgem funding**, Equinox must **directly acknowledge** and **build upon** other innovation projects relating to electrification of heat and flexibility by **UK DNOs** and others

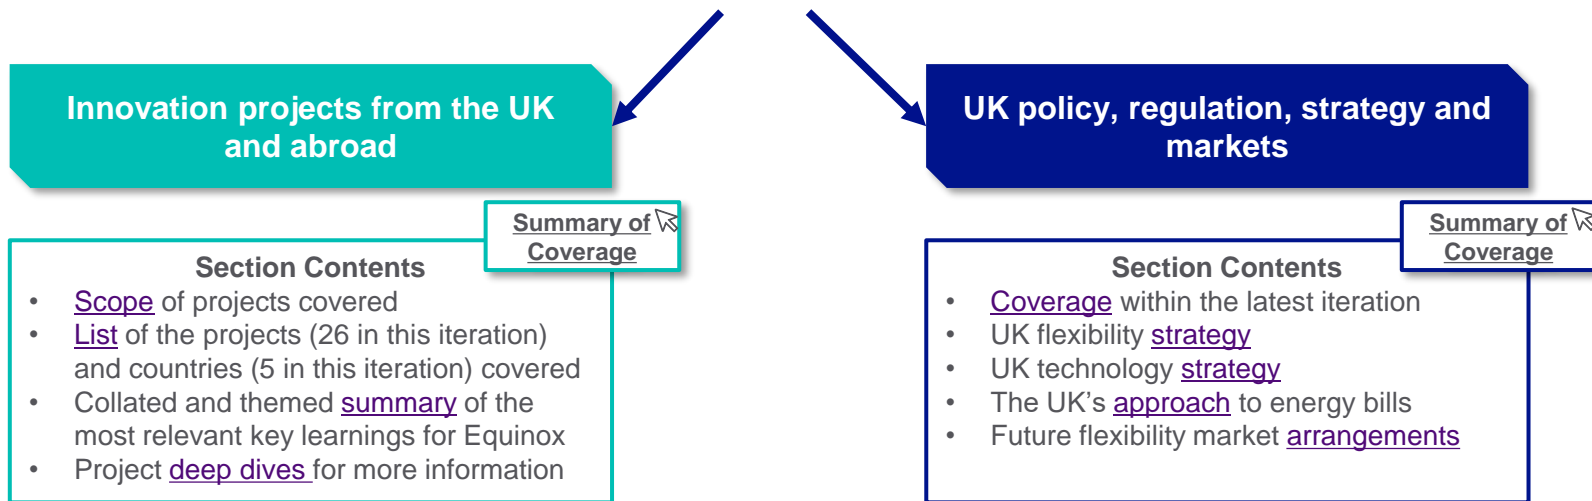

To ensure Equinox tests commercial arrangements **which reflect reality**, it is important to **keep abreast of current and upcoming** policies and regulations

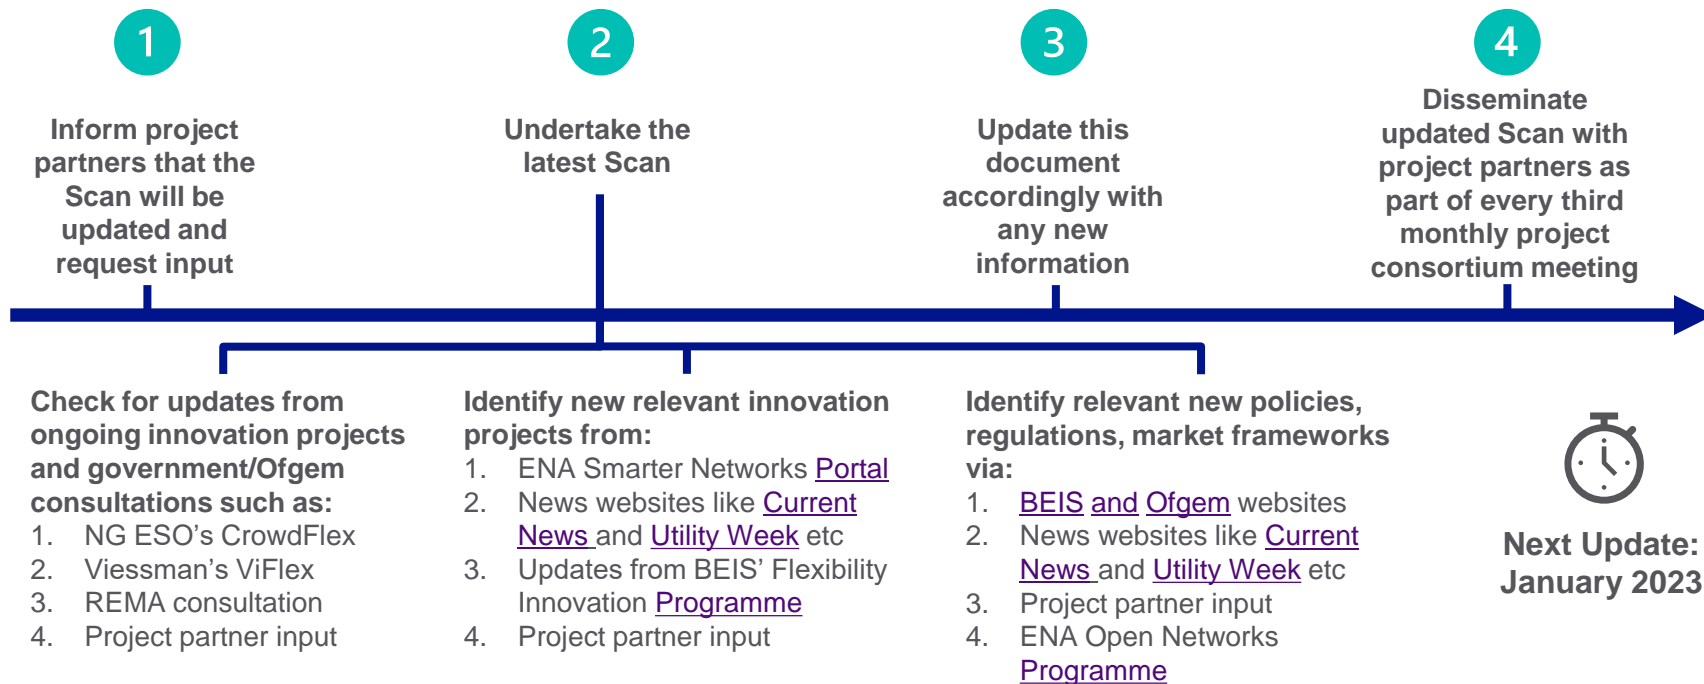

**Collating all relevant projects facilitates the identification of opportunities to disseminate Equinox learnings** to other projects who can benefit from them, fulfilling **another Ofgem funding condition**

# Guide: What is included within this Horizon Scan?

This Horizon Scan collates and summarises research and innovation projects, plus regulations and policy, which are deemed relevant to the delivery of the Equinox project. The document is split into two main parts

# Guide: The Horizon Scan will be updated every three months via the following process

# Horizon Scan Coverage: Innovation projects from the UK and abroad

The scan pools insights and learnings from completed and ongoing innovation projects across the following themes: <sup>1</sup>

1

## Domestic Energy Flexibility

Projects focusing on innovation in domestic flexibility from any source, not exclusively low carbon heat

### Relevance for Equinox

Learnings on the approach towards domestic consumers, modelled and experimental aggregated flexibility provided

2

## Commercial Trials at Scale

Projects focusing on a larger scale (1000+ participating households) trial of an innovative flexibility proposition

### Relevance for Equinox

Learnings on customer recruitment, minimising dropouts, regularity of engagement, results analysis

3

## Low Carbon Heating Innovation

Projects focusing on domestic low-carbon heating, not necessarily from a flexibility perspective

### Relevance for Equinox

Learnings on customer preferences, experience with remote control, common heat pumps concerns

## Projects found via:

1. Smarter Networks Portal

2. Flexibility Innovation Programme

3. News sites

4. Input from project partners

<sup>1</sup> Not mutually exclusive

# Horizon Scan Coverage: UK policy, regulation, strategy and markets

The scan extensively covers the UK's current and proposed approach towards:

1

## Flexibility Strategy and Targets

- Vision
- Existing arrangements
- Forecast capacity
- High-level targets

**Relevance for Equinox**  
Equinox must align with UK high level strategy

2

## Heat Pump/ Smart Meter Policy and Regulation

- Historic installation rates
- Targeted installation rates
- Current and suggested policies and regulations

**Relevance for Equinox**  
Project must react based on regulation for and pace of heat pump /smart meter rollout

3

## Energy Bill Policy and Regulation

- Price cap forecasts
- Current and proposed support packages for bills

**Relevance for Equinox**  
Trial design and incentives must reflect the current and future energy costs landscape

4

## Potential Future Electricity Market Arrangements

- Related to structure of flexibility markets
- Related to functioning of flexibility markets

**Relevance for Equinox**  
Final BaU-ready commercial offering must fit within the UK's realigned electricity market

Major sources include:

Electricity  
Distribution

2

# Innovation Projects

Projects covering domestic flexibility,  
low carbon heating innovation, and  
commercial trials at scale

nationalgrid

# Horizon Scan Coverage: Innovation projects from the UK and abroad

The scan pools insights and learnings from completed and ongoing innovation projects across the following themes: <sup>1</sup>

1

## Domestic Energy Flexibility

Projects focusing on innovation in domestic flexibility from any source, not exclusively low carbon heat

**Relevance for Equinox**  
Learnings on the approach towards domestic consumers, modelled and experimental aggregated flexibility provided

2

## Commercial Trials at Scale

Projects focusing on a larger scale (1000+ participating households) trial of an innovative flexibility proposition

**Relevance for Equinox**  
Learnings on customer recruitment, minimising dropouts, regularity of engagement, results analysis

3

## Low Carbon Heating Innovation

Projects focusing on domestic low-carbon heating, not necessarily from a flexibility perspective

**Relevance for Equinox**  
Learnings on customer preferences, experience with remote control, common heat pumps concerns

## Projects found via:

1. Smarter Networks Portal

2. Flexibility Innovation Programme

3. News sites

4. Input from project partners

<sup>1</sup> Not mutually exclusive

## 2.1. Approach to Project Scan

# Equinox is UK-based, so the scan focuses on the UK. Large-scale projects abroad also covered

Country

Key  
project  
leads

Reason  
for  
inclusion

As a UK-based project, Equinox stands to gain from key learnings coming out of other UK innovation projects, particularly those by other suppliers and DNOs. They can provide insights into UK consumer behaviour and preferences towards heat pumps and flexibility

Both countries have wider heat pump coverage than the UK, so can offer insights regarding commercial scale domestic heating flexibility innovation trials and programmes

Project partner Guidehouse has experience with projects in the USA and Canada which have a similar premise to Equinox – namely large scale commercial trials of domestic heating/cooling flex

## 2.II. Summary of Key Learnings

# Key learnings from 26 projects have been summarised within seven buckets

1

### Customer Offering

How to achieve a compelling proposition

2

### Flexibility Impact

How to ascertain the overall flex benefits

3

### Recruitment

How to maximise and maintain participation

4

### Customer Preference

How to meet participant needs

5

### Engagement Strategy

How to optimise engagement throughout the trials

6

### Trial Design

How to design and analyse the trials being undertaken

7

### Market Design

How to ensure Equinox is ready for business as usual

# A compelling customer proposition is key for unlocking flex, but this can be complex to achieve

To maximise uptake of demand side response (DSR) / flex services, focus on **financial concerns of participating households** by **improving customer proposition** (Projects 4, 13 on [project list](#))

There are **many ways of reimbursing customers** for flex, from **different tariffs** (5, 21, 22), **bill rebates** (6, 23, 25), and **per kWh payments** (24). **Sign up bonuses** are also common for trials (12, 21, 23, 24)

Complexities of contract approval process and service design can **present delays and challenges** (13), including concerns about **personal data sharing** (24), **explicit consent requirements** (9), **authentication** (7), etc.

The service summary from WPD's Sustain-H domestic flexibility product, which came out of the Future Flex project, **provides guide elements** which need to be considered for Equinox commercial arrangements (9). An element that made this service proposition successful was its **simplicity**.

# Price signals and direct load control offer different flexibility benefits for networks

Critical peak pricing can motivate changes in space heating **even when there is no direct price signal to do so** (project 20 on [project list](#)). i.e. price signals can induce **wider behavioural change and flexibility**

Participants can **respond at short notice** to price signals (2, 6, 21, 22), with high participation rates (26)

Giving participants control over temperature limits results in **hugely varying flex potential**, with households **tending towards the extremes** of min and max flex provision (22)

Time of use tariffs and turn-down events can **significantly reduce peak demand** (2, 5), though specific potential for UK heat pumps **remains unclear** (2). Turn down can induce increases elsewhere (4, 26)

Large-scale **turn-up trials** have also demonstrated that there is **significant flexibility potential** from domestic assets when consumers are asked to increase their usage (2, 6)

**Modelling project results** will aid understanding the role HP turn-down could play in a peak 1-in-20 year winter (10), how HP turn-up can reduce wind curtailment (11), and the flexibility potential of aggregated low carbon domestic heating assets (3, 16)

# Recruitment requires proactive engagement and careful consideration of incentives

Risk-free aspect of trials can be a **crucial incentive to enrol customers** (22 on [project list](#)). Conversely, other trials saw a **lack of awareness** from participants that incentives had been made available to them (23)

Working with a **trusted third party** (e.g. charity) **adds legitimacy** to recruitment efforts, with **face-to-face interactions** important for building trust and engagement **with vulnerable customers** (4). A voluntary compliance scheme will help build consumer and DNO/ESO trust in domestic flexibility (20)

Customers need **support and resources** to understand new systems, tariffs, etc, and to encourage the switch to **new routines** (5, 7, 13, 14)

**Initial concerns** for V2G centred around general EV price and operational concerns like charging time (7) – could Equinox find a similar relation between heating flexibility and more general heat pump concerns?

**Interactive diagrams and videos** are a great resource for making recruitment **more accessible** (8, 24)

**Cost of heat pump** and accompanying required retrofits can be **prohibitively high barrier** to hitting recruitment targets (12)

# Acknowledging and aligning with customer preferences is necessary for success

 Opt-out flexibility initiatives offer **more flex** than opt-in, provided the **incentive is sufficiently high** (5 on [project list](#))

 **Unacceptable noise** from hybrid/ heat pump systems for participants in some trials (14)

 **Ease of use**, comfort, **reliability**, and upfront and running costs are the primary aspects of a heating system that customers **value** (18)

 **Do not overpromise:** on one trial, many customers did not achieve the bill savings they were promised, with some actually paying more (13)

 One trial allows customers to **block times** for which they would not like to have their heat pump remotely controlled (25)

 **Simple technology is preferred** e.g. a one-app solution (7) or a simple proposition (9)

# Active and continuous engagement better guarantee longer-term participation

Customers can be initially **highly concerned** about **changing their routine**, so must be **guided** through the early behaviour change (5, 7 on [project list](#)). Personalised tracking and advice empowers participants (8, 26)

**Open house events** can result in those who show up delivering significantly more flex (21)

Without **continuous engagement**, participation dropped off in certain trials (4), and has been shown to be higher **directly after engagement**. This must be balanced with **messaging fatigue** which causes disengagement (5)

Large-scale domestic flexibility trials have generally seen **large and enduring buy-in**. For one SPEN trial, **almost 100%** of participants found the experience easy and beneficial. ~70% said they would consider managing their energy use **at least three days per week** (6)

In CrowdFlex, participants who switched to a flex price signal tariff **consistently changed their demand profile** over the six months of the trial (2)

Powerloop showed 85% of participants would want to continue using V2G, but that a stronger business case

# Various projects assist the setting of ambitious trial objectives and robust impact evaluation

 Large scale heating flexibility trials in Germany (24, 25 on [project list](#)), Canada (21, 22), and USA (23) all offer **slightly varied trial designs** from which Equinox can cherry-pick

 Standard event time for customers is a **maximum of two hours** (2, 6, 24), though other trials went with four hours (5) and one hour (25)

 If designed well, direct load control can occur **without participants even noticing** when there has been a control event (13, 23)

 Projects like Right to Heat (15) can provide insights to accompany Sero data on **how heat pump use interacts with other low carbon technologies** like solar PV, thus how to account for these in the trial design

 The Modelec trial in France introduced **gamification as an engagement tool** (26), rewarding ‘better consumption’ with points

# Innovation and research can guide Equinox towards a solution that fits with future markets

Intraflex (1 on [project list](#)) has proven that **aggregated domestic flexibility procured near real-time can compete with traditional dispatchable flexibility on price**

CrowdFlex Alpha should uncover **more accurate stochastic flexibility forecasting modelling methods (3)**, which can help DSOs to hone their procurement needs for domestic flexibility

In Sustain-H, WPD have a domestic flexibility product which **could be tailored for Equinox (9)**

Learnings from **global energy market models** could feed into a bottom-up market model for the UK (19)

## 2.III List of Projects Considered

# Projects for key learnings 1/3

Project	Country	Lead	Description	Domestic flexibility	Trials at scale	Low carbon heat	Project dates
1. <a href="#">Intraflex</a>		 Serving the Midlands, South West and Wales a nationalgrid company	First close to real-time trading of domestic flex, allowing market to determine price	✓	✓		Oct 2019 - Nov 2021
2. <a href="#">Crowdflex NIA</a>			Large-scale commercial trial to understand the domestic flexibility across various LCTs	✓	✓		Apr 2021 - Mar 2022
3. <a href="#">Crowdflex SIF Alpha</a>			Deeper dive into the system role of domestic flexibility, plus potential stacking opportunities	✓	✓		Aug 2022 - Jan 2023
4. <a href="#">Energywise</a>			Understand and trial energy efficiency and commercial arrangements with fuel poor customers	✓	✓		Jan 2014 - Sep 2018
5. <a href="#">SAVE</a>			Understand whether price signals can impact household peak demand	✓	✓		Jan 2014 - Jun 2019
6. <a href="#">Flexibility Demand Shift Trial</a>			Turn-up trial where consumers were rewarded with free energy for using abundant renewables	✓	✓		Mar 2022 – Apr 2022
7. <a href="#">Powerloop</a>			Residential V2G trial with Nissan Leafs	✓	✓		Mar 2018 - Mar 2022
8. <a href="#">Vehicle-to-Grid Trial</a>			Use bidirectional charging to balance the grid and improve energy efficiency.	✓	✓		Jan 2021 - Jan 2023
9. <a href="#">Future Flex</a>		 Serving the Midlands, South West and Wales a nationalgrid company	Design and trial a new flexibility product for unlocking domestic flexibility	✓	✓		Nov 2021- Mar 2023

## 2.III List of Projects Considered

# Projects for key learnings 2/3

Project	Country	Lead	Description	Domestic flexibility	Trials at scale	Low carbon heat	Project dates
10. <a href="#">Peak Heat</a>		 <b>WESTERN POWER DISTRIBUTION</b> <small>Serving the Midlands, South West and Wales a nationalgrid company</small>	Desktop modelling study to better understand impact/ flexibility of HPs	✓		✓	Feb 2021 - May 2022
11. <a href="#">4D heat</a>		 <b>Scottish &amp; Southern</b> Electricity Networks	Flexible residential heating demand to absorb wind power that would otherwise have been curtailed	✓		✓	May 2020 - Nov 2020
12. <a href="#">LEO – Smart Flex</a>		 <b>LEO</b> Local Energy Oxfordshire	Understand the potential for flexibility services to help enable a zero-carbon future for rural communities with planning constraints	✓		✓	Jan 2022 - Jun 2023
13. <a href="#">No Regrets</a>		 <b>passivSYSTEMS</b>	Bring a novel hybrid HP commercial offer to market, and experiment with DSR viability	✓		✓	Oct 2018 - Apr 2019
14. <a href="#">HyCompact</a>		 <b>UK Power Networks</b>	Trial of 7 new single unit hybrid heating systems	✓		✓	Aug 2020 - Jun 2022
15. <a href="#">Right to Heat</a>		 <b>UK Power Networks</b>	Develop best practice decarbonising heat and decreasing bills in gas grid connected urban social housing	✓		✓	Feb 2022 - Jul 2023
16. <a href="#">Neighbourhood Green</a>		 <b>UK Power Networks</b>	Propose an industry standard view on diversity factors for heat, understand flex potential	✓		✓	Feb 2022 - Feb 2024
17. <a href="#">CommuniHeat</a>		 <b>UK Power Networks</b>	Developing a roadmap for how rural communities can switch to low carbon heat	✓		✓	Oct 2020 - Jun 2022

## 2.III List of Projects Considered

# Projects for key learnings 3/3

Project	Country	Lead	Description	Domestic flexibility	Trials at scale	Low carbon heat	Project dates
18. <a href="#">Freedom</a>		 WESTERN POWER DISTRIBUTION <small>Serving the Midlands, South West and Wales a nationalgrid company</small>	Balancing networks through optimising use of HHPs			✓	Oct 2016 - Jan 2019
19. <a href="#">Redmast</a>		 WESTERN POWER DISTRIBUTION <small>Serving the Midlands, South West and Wales a nationalgrid company</small>	Evaluating current energy market set-up to investigate future market designs	✓			Jan 2022 - Aug 2022
20. <a href="#">HOMEflex</a>		 Scottish & Southern Electricity Networks	Development of a Code of Conduct to build trust in domestic flexibility market and support consumer engagement	✓	✓	✓	
21. <a href="#">Regulated Power Pricing pilot</a>		 London Hydro	Critical peak pricing trial of cooling flex with & without real time data	✓			May 2016 - Apr 2019
22. <a href="#">Advantage Power Pricing Pilot</a>		 alectra	Tests response of technology-enabled residents to dynamic price signals	✓	✓	✓	Nov 2015 - Aug 2019
23. <a href="#">EnergyWise Home</a>		 DUKE ENERGY	Residential trial of direct load consumption for heating/cooling.	✓	✓	✓	Jan 2014 - Sep 2018
24. <a href="#">Viflex</a>		 VIESSMANN	Test how reduced HP demand can stabilise transmission system	✓	✓	✓	Dec 2020 - Ongoing
25. <a href="#">HeatFlex</a>		 tennet	DNO cooperation to intelligently use flexibility from distributed heat pumps to avoid grid bottlenecks	✓	✓	✓	Jul 2018 - Jun 2020
26. <a href="#">Modelec</a>		 POWEO	Test load shedding models for consumers in response to different demand responses.	✓	✓	✓	Jan 2011 - Jul 2014

# 1: Intraflex

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design**

## Project Overview

<b>Description</b>	<ul style="list-style-type: none"> <li>Develop <b>market design</b> for an <b>integrated flex market</b> aimed at serving <b>both ESO and DSO</b></li> <li>First time flex services in local distribution network were <b>continuously traded close to real-time, allowing market to determine price.</b> <a href="#">More info</a></li> </ul>
<b>Project Dates</b>	October 2019 – November 2021
<b>Project Partners</b>	

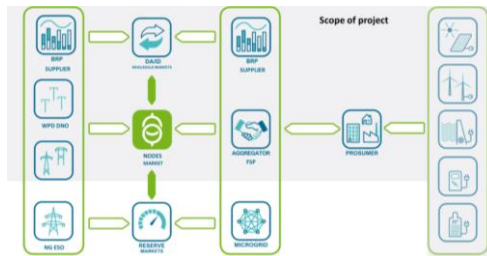

## Key Learnings for Equinox

- Intraflex provides evidence of what a **liquid competitive market** for flexibility **encompassing domestic assets** could look like in the future
- This includes near real-time flexibility services being procured from domestic energy suppliers – a use case for Equinox to trial?
- It also **unlocks stacking opportunities** across multiple flex markets/products
- The concept is **proven to work** with the Balancing Mechanism. Both the DSOs and the supplier can value flex **closer to its real value**, rather than locking parties into long-term contracts at a certain price
- NODES interface was **well-received** as a bid-placing platform – can provide a **back-up option** for Equinox implementation

## Project Methodology

- Worked with seven flex asset owners to create a marketplace where different types of flex could **compete on a level playing field**
- Opened a **week ahead** of flex needs; implemented **different pricing strategies** to understand how asset owners would respond
- LCTs like EV chargers and battery storage competed against diesel generators **on price for the first time**
- Phase 1: 241 trades. 50.5MWh at average price of **£386/MWh**
- Phase 2: 1,198 trades. **774 MWh**
- Savings **up to 4%** on flex price through market price competition

## Intraflex Project Architecture

Source: [WPD](#)

# 2: CrowdFlex NIA

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	Quantify electric flex potential from UK homes, <b>identify key parameters which influence flex</b> , inc. <b>incentive cost</b> . <a href="#">More info</a>
<b>Project Dates</b>	April 2021 - March 2022
<b>Project Partners</b>	   

## Project Methodology

Phase 1 analysed 4 distinctive historical consumption datasets, arising from 2 intervention types:

1. **Enduring:** move from flat energy price to dynamic ToU tariffs (Octopus Go and Agile). 20,378 analyzed customers
2. One-off: single events of limited duration. Rewarded change in customer demand over a specified 2-hour duration. **'Big turn up'** events with 19,206 participants and **'big turn down'** events with 396 partakers. Customers informed of request & opted in ahead

## Key Learnings for Equinox

- Households that switched from a flat to a Dynamic (Agile) or Static (Go) ToU tariff **reduced proportion of daily demand consumed during evening peak (evening 4-7pm) by an average of 15% & 17% respectively**
- **Greater reduction for EV owners than non-EV owners**, since there is a higher peak
- Robust move of demand out of the peak evening period, **enduring over 6 months trial data available**
- Big Turn Up trial, **far greater turn up for EV-owning households. More equal** between EV -0.6kW (-59%) and non-EV -0.5kW (-41%) households **for Big Turn Town**
- Very high level of participation for Big Turn Up in EV owning households (63%) → customers willing to provide EV assets for flexible charging. **Non-EV households** have a smaller technical capability for Big Turn Up; but **showed turn down capability equivalent to EV households; indicates that underlying demand (including appliances and white goods) is responsible for most of the reduction observed.**
- The small number of electric-heating customers (15%) were **not sufficient to provide reliable conclusions on the impact of tariff switching and Turn Up/Down on heating.**

# 3: CrowdFlex SIF Alpha

- 1 Customer Offering
- 2 **Flexibility Impact**
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 **Market Design**

Project Overview	
Description	<ul style="list-style-type: none"> <li>Strategic Innovation Funding (SIF) project to better understand system needs for domestic asset flexibility. <a href="#">More info</a></li> <li>Plan a test of multiple flex services in a real-world trial to explore stacking opportunities</li> </ul>
Project Dates	August 2022 – January 2023
Project Partners	

## Key Learnings for Equinox

- Learnings will become apparent as the project unfolds
- CrowdFlex and Equinox are both undertaking large scale commercial trials, so can **share learnings between one another**
- CrowdFlex should develop useful learnings on **system challenges** like peak demand, constraints, and potential balancing solutions which domestic assets can provide
- Learnings can feed into a **potential role for the ESO** within Equinox and provide evidence for Equinox commercial arrangement **use cases**
- CrowdFlex’s flexibility stochastic modelling could aid understanding around **future flexibility procurement**, whether/how DSO and ESO flexibility needs **complement or compete**, and what **stacking opportunities** are available
- Update in the next Horizon Scan iteration

## Project Scope

Follows from SIF Discovery phase in early 2022. The project looks to:

- Understand **system needs** and **utilization** of domestic assets
- Plan for real-world trials of flex services, including **stacking**
- Improve clarity around data needs and **stochastic** (rather than current deterministic) statistical approaches to **forecast flex**
- Better understand **potential regulatory barriers**
- Engage successfully with consumers to **incentivize behaviour change** so that the trials can deliver expected commercial and CO2 reduction benefits

# 4: Energywise

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	<ul style="list-style-type: none"> <li>How can <b>vulnerable customers</b> engage in and benefit from new energy efficiency schemes/ technologies? Challenges and successful approaches to engaging with these customers to achieve aims <a href="#">More info</a></li> </ul>
<b>Project Dates</b>	January 2014 - September 2018
<b>Project Partners</b>	

## Key Learnings for Equinox

- First time energy supplier & network operator worked together with **trusted 3rd party** (local charity) to **engage with fuel poor & traditionally hard to reach customers**
- Trial 1 achieved 5.2% in average evening peak demand; £14 annual savings per household; 3.3% average energy consumption reduction
- Trial 2 ToU tariff 2.2% reduction in evening peak, but 22.2% increase in weekend peak. Critical peak rebate 1.5% reduction in evening peak
- Door-to-door interactions were crucial**. Participation still dropped off as trials progressed

## Project Methodology

538 social tenants Tower Hamlets (E. London) engaged in two trials

- How can they **participate in energy saving opportunities**? Install smart meters and energy efficiency devices and advice
- 86% active participants consented to **new ToU tariff arrangements: Critical peak rebate Bonus Time** for prepay customers who were credited 10 units of back for every unit of energy saved within the bonus time.

**Home Energy Free Time** for credit customers where customers were offered a static fee and free electricity on either sat or sun, 9-5pm

## Demand Profiles by Trial

Source: [UK power networks](#)

# 5: SAVE (Solent Achieving Value from Efficiency)

Project Overview	
Description	<ul style="list-style-type: none"> <li>Understand whether <b>price signals</b> can <b>impact household peak demand</b> <a href="#">More info</a></li> </ul>
Project Dates	January 2014 – June 2019
Project Partners	  

## Key Learnings for Equinox

- SAVE used a randomised control trial methodology combined with household monitoring and detailed annual surveys to ensure results from its trials are replicable and can be modelled across the wider UK
- Customers often need some prompting to save energy; treatment effects generally highest after some engagement; but need to balance with messaging fatigue - too frequent messages  disengagement
- Enticing customers to stay out of the house during critical peak periods may result in even larger peak reductions than asking them to shift or cut
- Banded pricing/ similar ToU approach can be used by DNOs on networks where peaks are harder to predict in advance or where the network is constantly near capacity
- Here, banded pricing produced peak reductions of <7%
- Peak savings **higher in opt-out banded pricing trial** because their participation rate was far higher
- **The incentive has to be sufficiently high** to motivate participants – trebling the reward resulted in a significantly higher demand reduction
- For opt-in trial, peak savings **more consistent & predictable** but lower as there was a smaller % of the group participating.
- £/W reduction **lower in the opt-in group** than op-out group

## Project Methodology

- **2,000** customers took part in a **‘peak banded pricing’ trial** for 12 weeks from October – December 2018
- Customers set **consumption targets** with rewards for dropping to them. For first 6 weeks of the trial, participants paid **10p/h** they stayed below custom kW threshold. Then to **30p/h** for final 6 weeks
- Customers were split into opt-in and opt-in groups. **38% of opt-in group participated vs 98% for the opt-out group**

Banded Pricing	Event Schedule	10 p/hr Demand Reduction	30 p/hr Demand Reduction
Whole group	4 hours, every weekday	2.6%	7.1%
Participants only	4 hours, every weekday	4.2%	7.1%

# 6: Flexibility Demand Shift Trial

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

Description	<ul style="list-style-type: none"> <li>Turn-up trial in which consumers received <b>free energy</b> if they used enough extra during periods of high excess wind energy. <a href="#">More info</a></li> <li>Octopus: <i>'The Windy Day Fund'</i></li> </ul>
Project Dates	March – April 2022
Project Partners	 

## Project Methodology

- 2,500 Octopus Energy customers across Dumfries & Galloway
- Households were **directed to power up usage** when excess wind supply was highest across **six events**
- 2-hour test events between **5:30-7:30am** and **7:30-9:30pm**
- Customers notified customers who had opted in **the day before** each trial window

## Key Learnings for Equinox

- Provides a potential model for turn-up trials, should Equinox choose to trial turn-up as well as turn-down
- Households appear very willing to respond to requests for small periods of adjustment
- Surveys suggests that, if the trial had continued for longer than 6 weeks, participants would have continued being engaged, most of them for multiple days per week

## Customer Offering and Results

- Households who increased their usage by more than 10% **were credited back all the energy they used** in the two-hour timeframe. Those who used more than 100% extra were credited **double the amount** they had used
- The average customer received **£5** of free energy. Maximum saving was **£73**
- Total of **20 MWh** of power demand was shifted out of peak hours
- 50%** of participants **hit their target** on average per event
- Average turn up per event was 1.68 MW**
- 98% of participants found the experience **beneficial and easy to do**
- 46% said they would **consider managing their energy use five days/week**; 22% three days/week; 100% at least one day/week

# 7: Powerloop

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	<ul style="list-style-type: none"> <li>Residential <b>V2G</b> trial with Nissan Leafs. This is to understand whether/how <b>price k</b> impact household peak demand. <a href="#">More info</a></li> </ul>
<b>Project Dates</b>	March 2018 - March 2022
<b>Project Partners</b>	  

## Project Methodology

- Installation of chargers & delivery of cars to **135** Powerloop trialists. Learning from initial customer experience
- Collection of **data** from chargers, cars and smart meters. Commercialisation of V2G through ancillary services participation (trial with National Grid on the Balancing Mechanism)
- Participants got a **sign-up payment** and If customers had their vehicle plugged into their charger and were available for the **V2G service** between **4-7pm** at least **12 times a month**, they were offered a **£30 monthly reward**
- Two thirds of the trial were put on **time of use tariffs** as well

## Key Learnings for Equinox

- 85% of trial customers would continue using V2G service, but **current level of incentives needed means there is no strong business case**
- Customers need **customer support** and **resources to help them understand** the system and their tariff
- One-app solution preferred** for both Octopus Energy and trial customers
- Some of the concerns of using V2G are linked to using an EV, so services should look to support customers with their adoption of EVs where possible - **could this be equivalent for flex from HPs?**
- Customers **initially highly concerned** about **changing their routine** – services should highlight this point during customer engagement to reduce those anxieties.
- Only **33%** of customers were commuting more than two or three times a week, **30%** were retired
- Nb awaiting closedown report**

Figure 2: Average percentage of customers plugged into their V2G charger at different times

Source: [Energy Saving Trust](#)

# 8: Vehicle-to-Grid Trial

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	<ul style="list-style-type: none"> <li>Using <b>bidirectional charging</b> to balance the grid and <b>improve energy efficiency</b> by harnessing the <b>potential of EVs to act as stores and sources of energy</b> <a href="#">More info</a></li> </ul>
<b>Project Dates</b>	January 2021 – January 2023
<b>Project Partners</b>	    

## Key learnings for Equinox

- Results have shown participants to **save up to £725/year**
- Lots of **interactive diagrams** and **short videos** explaining how the set-up works. Perhaps this could be done for Equinox with a short [demonstration video](#) of what happens.
- The **Kaluzza app** has various smart options like minimum charge levels, charging updates etc – could Equinox customers benefit from having extra information regarding their heat pump status? E.g. off for X minutes, corresponding temp., etc.?

## Project Methodology

- Ovo **installed 320 bi-directional EV chargers** to trialists across the UK in a project that lasted three years
- Using the Kaluzza app, customers enter a time by which their car must be fully charged
- The charger will charge up when demand on the grid is low, and export when demand is high (working around the customer’s charging schedule). Exported charge will go the nearest appliance that demands electricity.
- This could be in the owner’s home, in which case they receive no payment, but they spend less on grid electricity
- Any EV power exported that isn’t used to power the home is sold back to the grid, with any money saved appearing on **monthly statements** as a bill rebate.
- Effectively the **car batteries are used as a balancing tool**
- There are **override options** in the app if the customer changes their mind about when the battery needs to be full.
- Quite specific specifications on what a consumer must have to be part of the trial - Nissan electric vehicles (+30kWh battery), CHAdeMO cables, 6kW output for charge etc.

# 9: Future Flex

- 1 Customer Offering
- 5 Engagement Strategy
- 2 Flexibility Impact
- 6 Trial Design
- 3 Recruitment
- 7 Market Design**
- 4 Customer Preference

Project Overview	
Description	<ul style="list-style-type: none"> <li>NIA project to understand <b>current process limitations</b> for domestic flex providers. Demonstrate and test these solutions.</li> <li>Sustain-H DSO service designed for homes is now being transitioned to BaU within Flexible Power. <a href="#">More info</a></li> </ul>
Project Dates	January 2022 – June 2023
Project Partners	

## Project Methodology

- Phase 1: **participant engagement** through workshops, etc.
- Phase 2a: **commercial solution definition based on participant feedback** e.g. new testing methodology, bid options, contract definition. Focus on **step-change innovations, not BaU tweaks**
- Phase 2b: system build solution definition – converts commercial design into a **trial platform** for the second generation services
- Phase 3: new system **tried for at least two participants**

## Key Learnings for Equinox

- Most parties value design principle of simplicity adopted
- Unforeseen personal data challenges which need to be addressed
- Service seen as relatively hassle-free; low barriers to participation
- Service summary can guide discussions for commercial arrangements, and provides a framework of what should be included within Equinox arrangements

## Sustain-H Service Summary (from [here](#))

Scheduled delivery with 'drop-to' response	Pre-fault service. Delivery scheduled months in advance. Flex Providers deliver a pre-agreed change in import or export (kW) over a defined period of time. They reduce demand to a level at/below pre-agreed Target Demand, maintaining this over the full 4-hour Delivery Period duration
Delivery period and procurement	Two 4-hour Delivery Periods each weekday, aligning with the times of peak network usage. The service is procured every 6 months via a new online procurement portal, and Flexibility Providers will be able to change portfolio composition and contracted volumes on a monthly basis
Qualifying technologies and baselining	Each household must have at least one qualifying technology: EV charge-point, electric heat pump and home battery storage system. Baselines are pre-defined for each qualifying technology, fixed for each contracting period, and determined from the asset-make up of the portfolio
Metering and data submission	Two metering options are available to Flex Providers: asset-level and household-level; in both cases aggregated across the portfolio. Asset level metering takes data from the meters of qualifying assets only. Household-level metering is taken from smart meters, including the demand of the whole home. All meter data is submitted via APIs
Remuneration and location	Flexibility Providers are paid a fixed tariff per kW demand reduction relative to the baseline. Only homes in the relevant part of the distribution network (i.e., within CMZs) are eligible to participate. CMZs are grouped into high-medium-low value zones to provide a sharper price signal for the network zones where constraint alleviation is more valuable

# 10: Peak Heat

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	Desktop modelling study to understand the impact and flexibility of HPs, including the impact of a <b>peak winter</b> (1 in 20) on the network due to both <b>direct</b> (e.g. poorer heat pump performance in cold conditions) and <b>indirect effects</b> <a href="#">More info</a>
<b>Project Dates</b>	February 2021 - May 2022
<b>Project Partners</b>	 

## Key learnings for Equinox

- Representative substation and housing archetypes identified for WPD’s network – **could be used for the simulation modelling and recruitment within Equinox** (i.e. try to have representative numbers for each archetype)
- **Customer and community level network modelling** could feed into Equinox trial simulations

## Project Methodology

1. Customer segmentation and archetype [creation](#): defining the **relevant archetypes of interest**
2. Heat market [landscaping](#): characterising **range** of technologies with a focus on domestic thermal storage
3. Customer modelling - exploring the range of impacts on load profiles from heating technologies including modelling the impact of ‘1 in 20’ peak winter condition, and **the flexibility that these may deliver**
4. Area typology modelling: **assess impact** of heat electrification on 4 local distribution network typologies
5. Recommendations – drawing together all the findings from the research, including conducting a high-level CBA to identify the **potential lowest cost options**

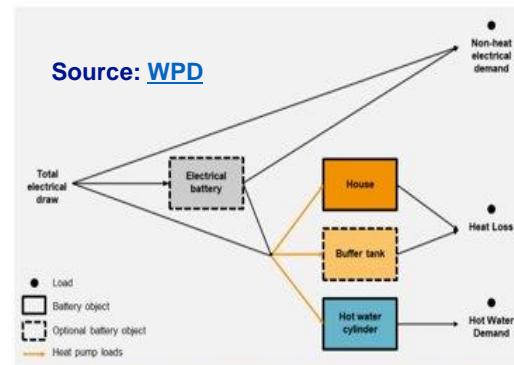

Figure 2: Individual house model set up in Plexos with four battery objects and three loads

# 11: 4D heat

- 1 Customer Offering
- 2 **Flexibility Impact**
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	Using a scenario model to investigate how flex demand from residential heat can absorb wind power that would otherwise be curtailed due to transmission constraints <a href="#">More info</a>
<b>Project Dates</b>	February 2021 - May 2022
<b>Project Partners</b>	

## Key Learnings for Equinox

- Model suggests 540GWh of otherwise curtailed wind power could be used for domestic heating across off-gas grid Scottish houses in 2030, delivering £49m in savings annually
- Demonstrates the potential of turn-up flexibility. Potential for Equinox to collaborate with National Grid ESO on turn-up opportunities

## Project Methodology

- Only **off-gas grid** houses in Scotland were considered for the model. Digital twins were used to provide residential thermal models
- Flexibility models produced for the most **cost-effective demand and ToU electricity tariff profiles** on a daily basis
- Consumers assumed to use home space heating appliances when electricity is cheaper - when there is surplus wind energy - so less wind energy needs to be curtailed
- Furthermore, **smart controlled heat pumps** were modelled that would automatically heat at times when it is cheaper to do so

# 12: LEO - Smart flex heat pump trial

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

Project Overview	
<b>Description</b>	Understand the potential for heat pump flexibility services in rural off-gas grid Oxfordshire communities with planning constraints. <a href="#">More info</a>
<b>Project Dates</b>	January 2022- June 2023
<b>Project Partners</b>	   <p style="text-align: center;"><b>PEOPLE'S POWER STATION</b></p>

## Key Learnings for Equinox

- There have been **difficulties in recruiting** participants because of the **costs** of purchasing the heat pump and the potential retrofit measures to make their homes heat pump suitable
- Also, difficulties getting the three participants **'Trial Ready'**
- The [early recruitment stages](#) demonstrate how the trial can be advertised without going into exact details of the commercial arrangements and trial design
- Lots can be learnt from the various **incentives** offered to participants

## Project Methodology

- Work with homes in two Oxfordshire villages to **install HPs** and **smart monitoring** to test viability of providing grid flex, **inc. direct control**
- The original aim was for **15 homes** but to date, only **3 houses** have signed up
- These three properties have **communication equipment** from **Passiv UK** installed which will allow project LEO to control their HPs as part of the trial
- LEO will turn the HPs up and adown to see if they can deliver flexibility
- They are currently (Summer 2022) testing the control of the participants HPs to see if they are **ready for winter 2022**
- The trial is integrated with **Peoples Power station 2.0**. This is an online tool developed with Low Carbon hub to be a centre for the **trials controls, monitoring and data collection**

## Incentives for Participants to Sign Up

- A free home assessment to identify an approach to home retrofit, ensuring homes are low carbon, energy efficient and fit for the future (worth £350)
- The cost of (A third party energy efficiency retrofit company) [cosy homes Oxfordshire's](#) project management service will be covered (up to £750)
- Communications, monitoring equipment and training on how to use HP
- £300 compensation payment in turn for the flexibility the participants will offer through-out the trial

# 13: No Regrets

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

Project Overview	
Description	Bring a novel hybrid HP offer to market, and allow for DSR experimentation to assess viability and consumer response. <a href="#">More info</a>
Project Dates	October 2018 - April 2019
Project Partners	    

## Key Learnings for Equinox

- Complexities of contract **approval process** and **service design** presented delays and challenges (but overcome)
- For the fully automated DSR which flipped between the HP and gas boiler as needed, **consumers mostly did not notice when the switch was made**
- Those enrolled on ToU tariffs largely **cannot distinguish** between the time they spent on this tariff and the time spent on a 'normal' tariff
- To maximise uptake of DSR services, **focus on financial concerns** of participating households by **improving customer proposition**
- Many households felt the *Future Heat* service **had not reduced their energy bills as they had expected** when signing up – for some the costs were higher than before

## Project Methodology

- Hybrid heating systems installed into **95 homes** under *Future Heat* commercial offer by **EDF**. **43 homes** then went on to participate in DSR experimentation (using EDF's **PowerShift trading** platform)
- EDF** offered a fixed price HP installation for **under £100**, with EDF recovering capital cost through the assigned **Renewable Heat Incentive payments**

# 14: HyCompact

- 1 Customer Offering
- 2 Flexibility Impact
- 3 **Recruitment**
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

### Project Overview

<b>Description</b>	Trial of 7 new single unit hybrid heating systems; follows from Freedom project <a href="#">More info</a>
<b>Project Dates</b>	August 2020 - June 2022
<b>Project Partners</b>	  

### Key Learnings for Equinox

- Monitor performance of hybrid systems to establish full operational **data**, assess **network impacts**, explore **flexibility** opportunities. Plus **engaging** with participants to get their feedback
- Using a new system combining gas boiler, ASHP, smart control software in a single unit

### Key Learnings for Equinox

- Feasibility of single unit hybrid system proven. Requires a little more inside space than a standard boiler, so it is **not suitable for all UK homes**
- Early trial homes reported unacceptable level of noise and vibration from the units
- Limited number of installers available in the UK for this unit
- To give confidence to a homeowner of a new heating system, it does require homeowners to have **appropriate information and guidance about what to expect from their new system**. Although it does look like a conventional combi boiler, it does have a small heat pump inside which behaves differently and will not activate the heat pump component for immediate calls for heat, but rather pre-heat to meet the set point.
- (N.b. awaiting closedown report)

# 15: Right to Heat

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	Develop <b>best practices for decarbonising heat and decreasing bills</b> in gas grid connected urban social housing. <a href="#">More info</a>
<b>Project Dates</b>	February 2022 - July 2023
<b>Project Partners</b>	   

## Project Goals

- Trial single-unit hybrid heating system coupled with solar PV installations, smart controls, and access to the flexibility market in **10 social housing homes**
- Evaluate impact of installations on **consumers in vulnerable situations**. Trial **different ways of lowering costs for consumers**, and provide consumers with **longer term advice and coaching**
- Understand how different technologies can best operate **simultaneously to deliver consumer benefits**

## Key Learnings for Equinox

- Major learnings still to come
- Expected learnings on how to balance the interests of the consumer, social housing provider, supplier, and network operators when seeking to deliver a cost-effective decarbonisation strategy for social housing – this can help with the approach towards customers on Equinox who are in social housing
- **Update in the next Horizon Scan Iteration**

# 16: Neighbourhood Green

- 1 Customer Offering
- 2 **Flexibility Impact**
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 **Market Design**

### Project Overview

<b>Description</b>	Better understand future After Diversity Maximum Demand (ADMD) when low carbon technologies for heating are clustered; propose an <b>industry standard view on diversity factors for heat</b> , understand flex potential. <a href="#">More info</a>
<b>Project Dates</b>	February 2022 - February 2024
<b>Project Partners</b>	

### Project Methodology

- Leverage Whole Energy Systems Accelerator (WESA) to virtually cluster 'Living Lab' participants' homes with electric heating and other low carbon heating technologies. Monitor energy usage over time and in different weather conditions
- Analyse clustered data streams to assess ADMD, network response, flexibility potential
- Then design and **carry out a trial based on the results**. Qualitative research with customers to understand their requirements and experience of transition journey to LCTs

### Key Learnings for Equinox

Check for updates as part of next Horizon Scan iteration

# 17: CommuniHeat

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

### Project Overview

Description	Low carbon heating blueprint for <b>off-grid gas communities</b> (4m properties in UK) using electricity. <a href="#">More info</a> and <a href="#">website</a>
Project Dates	October 2020 - June 2022
Project Partners	  <b>OVESCO</b> 

### Project Methodology

- Install energy meters in village to measure consumption.
- Computer models to forecast impact of electrifying heat – simulations will investigate **costs, efficiency, and electricity network** impact of multiple different approaches, including shared district heating, medium sized heat pumps serving a few properties, or personal electrical heat pumps installed at each property
- Then look at potential **community finance models** for making the switch

### Key Learnings for Equinox

- **Community engagement** is key to decarbonising rural homes
- **Check for learnings from the final report during the next Horizon Scan iteration**

# 18: Freedom

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b>	Trial of 75 smart hybrid heating systems in Bridgend can help balance system needs <a href="#">More info</a>
<b>Project Dates</b>	October 2016 - January 2019
<b>Project Partners</b>	 

## Project Methodology

- Selection of the area for the trial
- Customer engagement plan
- Selection of the type and size of the heat pump
- Network modelling
- Mobilisation (procurement of equipment and services)
- Trials or field test, including measurements (install equipment)
- Analysis

## Key Learnings for Equinox

- Project learning indicates that a hybrid approach to decarbonising our heating that is combined with green gas growth could lead to the total decarbonisation of domestic heat
- Hybrid systems could deliver off-grid homes with major cost and carbon savings
- Hybrid system did not require major energy efficiency/retrofit upgrades (vs the need for these for pure HP)
- The smart control switched between appliances driven by cost – supporting the decarbonisation of heat in an affordable way and with limited behaviour change.
- Lots of useful learnings regarding customer perceptions of lower carbon alternatives to gas boilers
- *‘Shifting customers away from gas boilers being their sole source of space heating will be a challenge – customers are overwhelmingly positive about their existing heating system. **Ease of use, comfort, reliability and up-front and running costs are the primary aspects of a heating system that customers value.**’*

# 19: REDMAST (R&D of Market Structures)

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design**

### Project Overview

<b>Description</b> <a href="#">More info</a>	Evaluate current <b>energy market models for deficiencies</b> , and <b>propose future energy markets</b> which give <b>customers a more active role, while still protecting them</b> and achieving net zero
<b>Project Dates</b>	January 2022 - August 2022
<b>Project Partners</b>	 

### Project Methodology

- **Evaluate current energy market models** and focus on the current **issues** within the market
- Identify **future energy market requirements**, explaining these transition pathways under the current market structure and highlighting the key **barriers to change**
- Then **assess alternative market models from around the world** to develop a bottom-up model which will enable a better approach to designing future UK energy market models
- Develop **assessment criteria to assess market models** and analyse their relative strengths and weaknesses

### Key Learnings for Equinox

- The idea of a bottom-up energy model, where consumers have an active role in their energy consumption and the energy transition, could have parallels with Equinox's offering to customers
- No published results yet – [check for updates in the next Horizon Scan iteration](#)

# 20: HOMEflex

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

<b>Description</b> <a href="#">More info</a>	Develop a <b>Code of Conduct</b> to create an <b>inclusive, fair, and transparent marketplace</b> for Domestic Flexibility Services.
<b>Project Dates</b>	June 2022 – May 2024
<b>Project Partners</b>	  

## Key Learnings for Equinox

- Development and roll-out of a voluntary compliance scheme to help **build consumer and DNO/ESO confidence in flexibility**
- Could **improve customer experience** throughout whole cycle of customer’s engagement with Flexibility Services provider
- HOMEflex will highlight mechanisms by which vulnerable, fuel poor, or other groups could be left behind in the transition to net zero, which should provide useful **learnings for maximising and maintaining customer participation**
- **Update in the next Horizon Scan iteration**

## Project Methodology

- **Develop Code of Conduct** by mapping emerging business models, identifying actors/relationships, and considering how to treat different parties under this Code
- Establish **steering committee composed of key stakeholders** to provide input to and oversight of project
- Consumer engagement by undertaking four focus group sessions throughout the project to inform drafting of Code of Conduct and **assess potential impact of voluntary compliance scheme on market take up**
- **Establish frameworks for a voluntary compliance scheme**, including a dispute resolution mechanism

# 21: Regulated Peak Pricing Pilot

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

Project Overview	
Description	Critical peak pricing (CPP) trial of AC cooling flexibility with & without participants having access to <b>real time energy consumption data</b> for their households. <a href="#">More info</a>
Project Dates	May 2016 - April 2019
Project Partners	  

## Key Learnings for Equinox

- Participants could attend **open house events** to fix tech and ask questions: these groups yielded **substantial incremental estimated impacts**. I.e. customer engagement can deliver more flex
- Participants proved **nimble in responding to changes in price** with only 15 mins notice
- CPP motivates change in space heating consumption behaviour **even when there is no direct price signal to do so**. Most energy savings achieved by CPP group achieved in summer **non-event periods**
- No significant incremental savings for CPP/RT group vs CPP i.e. having access to real time consumption data has **no additional impact on domestic flex provision if price signals already in play**. But it does deliver small savings when there is no price signal
- \$25 payment at start; \$75 at end**

## Project Methodology

Tested three arrangements:

- CPP (+ **slightly discounted off-peak ToU tariff**), but subjected to **36 1-hour CPP periods over a year**. Customers received smart plug and load control switch to **automate some of the reductions** (DLC)
- CPP, plus participants had access to real time consumption data and notifications when overall energy consumption exceeded that of peer households (CPP/RT)
- No CPP, but access to real time consumption data (RT)

Pricing Period	Commodity rate C/kWh <sup>1</sup>	
	Standard	CPP & CPP/RT
Off-peak (7pm – 7am weekdays, all weekend)	6.5	6
Mid-peak (7-11am, 5-9pm, summer weekdays; 11am-5pm winter weekdays)	9.4	9.4
On-peak (11am-5pm, summer weekdays; 7-11am, 5-9pm, winter weekdays)	13.2	13.2
Critical peak: 18 1-hr events in summer, 18 in winter, 4-8pm weekdays	n/a	59.5

Source: Navigant

<sup>1</sup> Canadian Dollar cents

# 22: Advantage Power Pricing Pilot

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

Project Overview	
Description	Tests response of tech-enabled residential customers to dynamic price signals (mixed with user-enabled DLC). <a href="#">More info</a>
Project Dates	November 2015 – August 2019
Project Partners	  

## Key Learnings for Equinox

- DR savings delivered by participants **varied depending on conservation setting selected**.
- Most aggressive flexibility settings = more savings (~2kW); max comfort = least savings (0.12 kW)
- By the end of the trial, participants were **more likely to skew to one of the extreme settings**
- On average, participants reduced winter commodity costs by 9-27%. Summer by 0-10%
- APP participant population skews older, **principally motivated by bill savings (80%)**. 70% first initiative. Nearly 80% of respondents said that **risk-free aspect of program was very important in their decision to enroll**
- On average, participating in APP increased customer energy consumption (small, statistically insignificant) - due to off-peak prices being lower vs RPP

## Project Methodology

- Customers remained subject to the standard Regulated Price Plan (RPP) ToU rates, but also received **a shadow bill tracking what their bill would have been** under Advantage Power Pricing (APP) rate. If APP < RPP, participants receive the difference as a rebate. **No penalty if APP > RPP**
- All customers enrolled were equipped with thermostat, whose response to APP price fluctuations they could **automate**. Three alternative tech groups added to the program
- APP prices set to be revenue-neutral with RPP rates**, based on historical consumption patterns. i.e. if there is no DR, participant bills would be the same under both systems

Season	APP Price Period	Price (C/kWh <sup>1</sup> )	% Hours
Winter 2015/16	Critical Peak	70	0.3
	High	59	0.8
	Medium	29	4
	Low	17.4	12
	APP Off-Peak	4.9	83

<sup>1</sup> Canadian Dollar cents

Season	APP Price Period	Price (C/kWh <sup>1</sup> )	% Hours
Summer 2016	Critical Peak	65	0.4
	High	52	3
	Medium	26	5
	Low	13	8
	APP Off-Peak	5.9	83

Source: Navigant

# 23. Energywise Home

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

## Project Overview

Description	Direct Load Control (DLC) of domestic heating and cooling appliances <a href="#">More info; BaU offering</a>
Project Dates	January 2014 – September 2018
Project Partners	

## Project Methodology

- Two program-wide events called in summer 2016
- 10 events called for sample of 78 participants who had data loggers deployed
- **\$25 bill credit upon joining the program**, additional \$25 bill credit annually per appliance type controlled to encourage continued participation

## Key Learnings for Equinox

- Estimated impact per responsive set of heat strips controlled during the population events was 2.77 kW, and the estimated impact per responsive water heater during same events was 0.4kW
- Participants were **generally unaware of curtailment events when they happened**. >90% survey respondents indicated they had not been aware that an event had occurred recently. Of 23/301 who were aware of an event, only 2 reported a comfort level less than 5/10. Most were ‘very comfortable.’
- Program does not appear to be a key driver of supplemental heating use. Similar proportion of placebo survey respondents reported using supplemental methods for heating their homes during ‘event’ periods as those respondents subject to actual events
- **Fewer than half of participants were aware of the bill credits they receive as part of their participation**, despite receiving a hardcopy brochure explaining this

Project Overview	
Description	Test how aggregated HPs can contribute to a stable transmission system by reducing/shifting HP demand when system demand high. <a href="#">More info</a> and <a href="#">podcast</a>
Project Dates	December 2020 - ongoing
Project Partners	

## ViFlex Project Architecture

- **Single heat flow tariff** offered to consumers from the ViShare tariff plan options
- Customers receive sign-up **€120 euro flexibility bonus**, plus a further discount of **up to €0.10/kWh** if they sign up to have their HPs controlled remotely
- Discount appears stratified based on no. hours people are willing to block out for control. This is marketed to have the potential to save an extra **€200-400/year**
- ViShare’s current prices based on [this](#) are €0.61-65/kWh, plus €8-11 monthly charge – varies by location (the grid areas covered include all **eastern German states**, plus the city states of Berlin, Bremen & Hamburg)
- The heat pumps can **be turned off for a maximum of two hours a day**
- Customers define eligible **blocking times for control**, varying from no restrictions to certain hours a day when the customer does not allow control
- To ensure customer comfort, Viessmann’s energy platform takes data from the heating system into account, eg. resident heat accumulator temperature
- After the TSOs have requested flexibility, Viessman aggregate what has been provided by the participants and offer it to the TSOs via the **Equigy platform**

## Key Learnings for Equinox

- Very similar premise to Equinox, though here remote control is being promoted **via extra payments. Customers have choice about when they would not like to be controlled**
- Trial starts this winter, but potential learnings for the **recruitment strategy**. They have sign up sheets, a video explaining the project, and an interactive platform where customers can calculate average energy consumption
- Big emphasis on data privacy and customer data being kept anonymous throughout the project
- **Check for new learnings in future Horizon Scan iterations**

# 25: HeatFlex

- 1 Customer Offering
- 2 Flexibility Impact
- 3 Recruitment
- 4 Customer Preference
- 5 Engagement Strategy
- 6 Trial Design
- 7 Market Design

### Project Overview

Description	<ul style="list-style-type: none"><li>Flexible grid management to compensate for the loss of grid stability and <b>increased transmission bottlenecks</b> accompanying more renewables. <a href="#">More info</a> (in German)</li></ul>
Project Dates	July 2018 – June 2020
Project Partners	 

### Business as Usual operation

- Bayernwerk-connected HPs and direct heating systems are controlled remotely from November 1<sup>st</sup> – March 31<sup>st</sup> each year except weekends, and school and public holidays
- Specifically, the switching takes place at the following times:
  - From **7:30 am for a maximum of one hour**
  - From **10 pm for a maximum of one hour**
- When there is excess energy, heating devices are turned on
- In return, the consumer receives **reduced network charges** at the point of consumption

### Key Learnings for Equinox

- A **successful trial** showing how remote control trials can be translated into business as usual
- Customer offering for providing control is **reduced network charges**
- It is unclear exactly what the reduction is and whether it is contingent on the amount of flexibility provided or just for providing control
- Remote control periods are only for **one hour maximum**, but the use case is **limited** to relieving transmission bottlenecks

### Project Methodology

- Partners explored the extent to which over **170,000 existing controllable consumption devices** in the **DSO's** area with a total output of **~200 MW** could be used to increase grid flexibility and reduce grid congestion
- Controllable devices include electric storage heaters, heat pumps or water heaters. The project integrates them into grid management **via ripple control** from receivers which were installed decades ago
- TenneT and Bayernwerk first tested the feasibility of control requests from the former. These tests showed it was possible to react immediately to bottlenecks
- Further tests proved the reliability of the set-up in relieving grid congestion, paving the way to business-as-usual operation with more project partners

- 7 Market Design

## Project Overview

Description	<ul style="list-style-type: none"> <li>Test several <b>peak load shedding models</b> for consumers in various locations. Analyse their demand-response behaviour and acceptance of DLC. <a href="#">More info</a></li> </ul>
Project Dates	2011 - July 2014
Project Partners	  

## Key Learnings for Equinox

- **95% demand response acceptability** in consumers – 95% of customers responded to change in energy prices
- **Load shedding** by the shedding operator **did not save energy itself but smoothed out consumption peaks**
- Although this **worked as a flexibility tool**, it was found a **10% (average)** gain in consumption as consumers had more control and accessible control of their energy usage
- By giving customers exact information on energy consumption and by automatically controlling equipment it gave the customers the tools to reduce overall annual consumption

## Project Methodology

- **1000 households** voluntarily participated
- They were equipped with a **smart box** for measuring and controlling their consumption, specifically cutting appliances like water heaters, radiators, etc. for a short time to avoid peaks in consumption
- The project enabled development of **economic valuation models** and the defining of methods ensuring **consumer acceptance** with energy tariffs

## Dashboard and Gamification

- Consumers had a **dashboard** where they could view their daily/monthly consumption, energy expenditure of specific appliances, kWh and money saved, and monthly expenditure. They also **received personalised advice**
- Customers were also engaged through **challenges rewarding ‘better consumption’**
- **Rewards** included energy efficiency points and efficiency ratings
- **It is unclear whether these points translated into tangible rewards**

## Policy, Strategy, Markets and Regulation

Relevant policy and market designs  
and reviews relevant to Equinox

nationalgrid

# Horizon Scan Coverage: UK policy, regulation, strategy and markets

The scan extensively covers the UK's current and proposed approach towards:

1

## Flexibility Strategy and Targets

- Vision
- Existing arrangements
- Forecast capacity
- High-level targets

**Relevance for Equinox**  
Equinox must align with UK high level strategy

2

## Heat Pump/ Smart Meter Policy and Regulation

- Historic installation rates
- Targeted installation rates
- Current and suggested policies and regulations

**Relevance for Equinox**  
Project must react based on regulation for and pace of heat pump /smart meter rollout

3

## Energy Bill Policy and Regulation

- Price cap forecasts
- Current and proposed support packages for bills

**Relevance for Equinox**  
Trial design and incentives must reflect the current and future energy costs landscape

4

## Potential Future Electricity Market Arrangements

- Related to structure of flexibility markets
- Related to functioning of flexibility markets

**Relevance for Equinox**  
Final BaU-ready commercial offering must fit within the UK's realigned electricity market

Major sources include:

### 3. Policy, Regulation, Strategy and Markets

# An overview of UK policy, regulation, strategy and market reform relevant to Equinox

Sub-Section	1 UK flexibility strategy	2 UK technology strategy	3 UK approach to energy bills	4 UK future flexibility market
<b>Horizon Scan Goal</b>	Track progress towards and changes to the UK's flexibility strategy/ targets	Track strategy, regulation, and progress for heat pump & smart meter rollout	Track UK energy costs and government support measures	Track the options being considered for future market operation in the UK
<b>What is covered in this version?</b>	<ul style="list-style-type: none"> <li>Vision and targets</li> <li>Historic and forecast capacity</li> </ul>	<ul style="list-style-type: none"> <li>Historic and targeted installation rates for smart meters/ heat pumps</li> <li>Current/recommended policies and regulations</li> </ul>	<ul style="list-style-type: none"> <li>Price cap forecasts</li> <li>Government support packages for bills</li> <li>Proposed Ofgem regs for vulnerable customers</li> </ul>	<ul style="list-style-type: none"> <li>REMA consultation</li> <li>ENA Open Networks recommendations</li> <li>National Grid ESO recommendations</li> </ul>
<b>Main Sources</b>	<a href="#">Ofgem</a>	<a href="#">UK Govt</a> , <a href="#">CCC</a> , <a href="#">Ofgem</a>	<a href="#">Ofgem</a> , <a href="#">UK Govt</a>	<a href="#">UK Govt</a> , <a href="#">ENA</a> , <a href="#">NG ESO</a>

# Ofgem expects 4GW of flexible demand needed by 2030, en route to 57GW total flex by 2050

Source: [Ofgem](#)

Interconnection is expected to be the major source of flexibility capacity, but **flexible demand grows enormously**

To progress towards these goals, Ofgem's **Smart Systems and Flexibility Plan** sets out a **vision for the mid 2020s**

It expects that all flexibility technologies will have improved access to flexibility markets and can stack revenues across multiple sources of value (where this enables whole system optimisation)

Flexibility is preferred to new network build and renewables curtailment, and is expected to play a bigger role in securing supply through participation in the Capacity Market

There should be stronger investment signals for flexibility, such as changes to Contracts for Difference to balance system needs with large-scale deployment of low-carbon generation

Carbon reporting and monitoring should be business as usual, with the carbon intensity of flexibility markets compatible with net zero targets

# Ofgem's vision also contains ideals for growing flexible demand from household consumers

**Regulation** should be in place to enable **all consumers to provide system flexibility**, regardless of the size of their contribution, leading to a mature market for aggregated **consumer flexibility**

Innovative product selection, **rewarded participation for demand side response**, and smart tech should be incorporated across **all government policies** relevant to energy efficiency, heating and fuel poverty

**Smart meters penetration** should be **near-100%** for smaller scale consumers

**Market-wide half-hourly settlement by October 2025** to put incentives on energy suppliers to develop new tariffs encouraging consumers to **shift consumption** to when clean electricity is plentiful (and hence lower their costs)

**Ofgem's significant code review (SCR)** aims to change the **cost-reflectivity** of network usage to a way that better reflects variations in network costs associated with **location and time of use**

#### RELEVANCE TO EQUINOX

- Equinox is expected to deliver its business as usual product by the end of 2025 – it is important to ensure that this is consistent with Ofgem's vision for flexible consumer demand in the UK
- Elements like the SCR should be tracked closely to see what BaU will look like from a regulatory perspective by 2025. Section 3.IV of this document details potential future flexibility market set-ups which could be actualised by the SCR

# UK Heat Pump (HP) Roll-Out: slow progress towards an ambitious 600k/year 2028 goal

Historic and required UK annual installations of residential heat pumps (100s of thousands)

The UK is **well behind** in its [current rollout](#) – 1.48 installations per 1,000 households in 2021 makes it the worst in Europe. 15.3 is the required rate

Factors inhibiting rollout include: **high upfront/ operating costs**, **lack of engineers**, efficiency concerns, manufacturers **not pushing HPs enough**

UK govt [aims](#) to **reduce hardware and installation costs by 25-50% by 2025**, and **parity with gas boilers by 2030**, but costs [appear](#) yet to fall

**£450m Boiler Upgrade Scheme** provides **£5,000** towards new ASHP, or **£6,000** towards GSHP. Expected to support 90k installs over 2022-2025

CCC's [key recommendations](#) are to **rebalance gas and electricity prices** to ensure HPs are **cheaper to operate** than gas boilers, and for BEIS to publish its plans for a **market-based mechanism** for HP growth, which should include **obligations on manufacturers** to produce an increasing proportion of HPs

#### RELEVANCE TO EQUINOX

- Project will need to track rollout progress to understand how quickly recruitment pool is expanding, for both the winter trials and the BaU product
- Need to ensure that the project is not left behind should the rollout accelerate

# Smart meters targeted for all homes by the end of 2025, requiring accelerated rollout

Historic and required UK cumulative rollout of domestic smart meters operated in smart mode (millions)

Ofgem's [target for suppliers](#) is to install a smart meter in **every domestic property by the end of 2025**

Since January 2022, all suppliers have had **binding annual installation targets** through to 2025

Targets will be **reset annually** based on the proportion of a supplier's customer base **still with a non-smart meter**

The rollout must **accelerate rapidly** to meet Ofgem's target, from 12k/day (2016-19) to **20.6k/day** until the 2025 deadline

#### RELEVANCE TO EQUINOX

- Project close, and thus recommendations for business as usual commercial arrangements, is also scheduled for the end of 2025
- Keeping track of progress towards the rollout target enables the project to decide whether and how customers without a smart meter should be included within the trial design

# Sky-high wholesale prices are leading to huge customer energy bills via Ofgem's price cap

Historic and forecast evolution of Ofgem's Energy Price Cap (£)

**Ofgem's price cap** has since 2019 limited the rate an energy supplier can charge for default tariffs, with the aim of protecting UK customers from overpaying for energy

**The cap** has been **reviewed** every **six months**. Given current high wholesale prices and market volatility, this will now be **quarterly**, enabling the cap to respond quicker to changes in wholesale prices.

There remain concerns that the cap is **not the best way** to protect consumers from market volatility, particularly with quarterly reviews

Calls are growing to replace the price cap with a **social energy tariff**, under which lower income households receive **significant discounts** on their energy bills. These are funded spreading the costs across wealthier billpayers, either via taxation or higher bills

#### RELEVANCE TO EQUINOX

- Understanding what consumers are paying for their bills will impact the incentive payments that they receive to participate in Equinox, offer up their data for analysis, and ultimately turn off their heat pump

### 3.III. UK Approach to Energy Bills

# Announced UK government support measures for energy bills in winter 2022/23

**Energy Price Guarantee:** Automatic limit on amount consumers can be charged per unit of gas or electricity, so a **typical UK household will save around £700** on their energy bill this winter. In place from 1 October 2022 to 31 March 2023

**Energy Bills Support Scheme:** All UK households will automatically receive a **£400 total discount** on their energy bills via six monthly instalments from **October**

**Cost of living payment:** One-off **£650** payment for households on **means tested benefits**, paid in two lump sums of **~£325**

**Pensioner cost of living payment:** Households entitled to winter fuel payments get an extra **£300** alongside their usual winter fuel payments from **November 2022**

**Disability Cost of Living Payment:** A one-off **£150** will be paid to anyone in receipt of various benefits for disabled people and veterans, such as attendance allowance and disability living allowance

**Winter fuel payment:** **£150-300** available to people born before the 25/9/1956. Exact amount depends on various factors including age, marital status, living situation, etc.

#### RELEVANCE TO EQUINOX

- Understanding how much assistance UK billpayers will be receiving through government support will help to pitch the incentive amounts for Equinox participants

# Energy Price Guarantee Overview

## What is the Energy Price Guarantee and how will it affect customers?

The Energy Price Guarantee is a limit on the amount consumers can be charged per unit of gas and electricity. This means that **exact bill amount will continue to be influenced by energy usage**. Energy suppliers will adjust tariffs automatically, so **customers do not need to take any action** to get the benefits of this scheme. The £400 discount from the Energy Bills Support Scheme will be paid on top of this.

## RELEVANCE TO EQUINOX

- Understanding how UK billpayers will receive differing levels of government support depending on their tariff will help to pitch the incentive amounts for Equinox participants

## Customers on a standard variable tariff

- Average unit price for dual fuel customers paying by direct debit will be **limited to 34.0p/kWh for electricity and 10.3p/kWh for gas**, inclusive of VAT, from 1 October

## Customers on a fixed rate tariff

- **Unit price reductions of up to 17p/kWh for electricity and 4.2p/kWh for gas** will apply to customers that currently have unit rates above the Energy Price Guarantee
- A **'floor' unit price** averaging **10.3p/kWh for gas and 34p/kWh for electricity** will be introduced
- Customers on fixed rates that are already **below the floor unit prices** will continue on those rates, but **will not receive a further discount** for the duration of their fixed term
- Customers on fixed rates **that exceed the October Ofgem price cap** will receive **the full discount (17p for electricity, 4.2p for gas)**

# Review of Electricity Market Arrangements (REMA) - Overview

What is the purpose of and timeline for REMA?

BEIS consultation reviewing how to **reduce reliance on fossil fuels** and enabling **abundant and cheap renewables** to drive the design of the future electricity markets

Concerns reform to all **non-retail electricity markets**, including wholesale market, balancing mechanism, and flexibility markets

The consultation aims to narrow down the current plethora of future market options presented

**Closes October 2022**, BEIS response in winter 2022/23

REMA addresses the following challenges seen in the current market set-up

- 1 **Reliance on support schemes** to drive renewable investment currently **disincentivises** generating plants to **operate more flexibly**
- 2 **Lack of investment signals** for low carbon flexibility assets, which will require **more revenue streams** outside Capacity Market to **expand at required pace**
- 3 The current single national wholesale price leads to the system **missing the low-price benefits of renewables** due to the marginal pricing method which allows expensive fossil fuels to set the electricity price
- 4 **Limited temporal signals** for flexibility which we know will reduce system costs

#### RELEVANCE TO EQUINOX

- The REMA outcome will narrow the electricity market options, including flex markets, which will be considered for the UK going forwards. This impacts the future BaU market operation with which Equinox will have to be consistent

# REMA – Consulted Options

Wholesale market - location	National pricing	✓ Zonal pricing	✓ Nodal pricing				
Wholesale market - tech	Unified market		✓ Split by characteristic				
Wholesale market - balancing	National		✓ Local then national				
Wholesale market - price formation	Pay-as-clear		Pay-as-bid				
Wholesale market - dispatch	Self-dispatch		Central dispatch				
Mass low carbon power	Existing CfD	✓ CfD with more price exposure	Deemed generation CfD	Supplier obligation	✓ Revenue cap and floor	Dutch subsidy	Equiv. firm power auction
Flexibility	✓ Optimised CM	✓ CfD with flex enhancements	✓ Supplier obligation (inc. CPS)				
Capacity adequacy		Capacity payment	Centralised reliability option	Decentralised reliability option	Targeted tender	Strat. reserve	
Operability	BAU	BAU+	Local markets	Changes to CfD/CM design	Co-optimisation	Dedicated support scheme	

✓ Relevant to flexibility

- This figure illustrates the **range of options** upon which the consultation aims to gauge views
- They are **not mutually exclusive** and can be **stacked**
- Those **relevant to flexibility** are discussed on subsequent slides

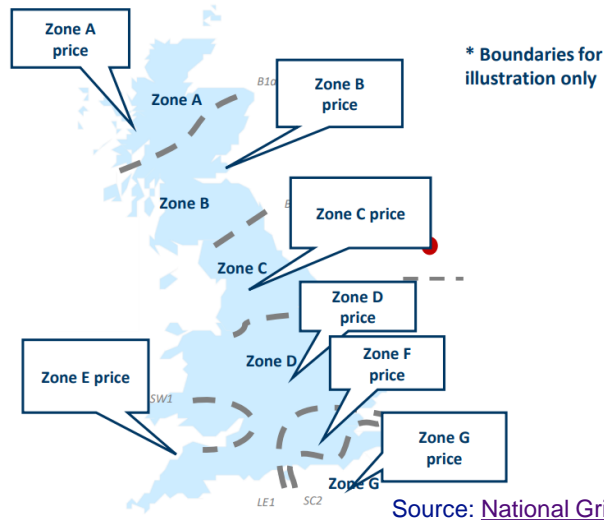

## RELEVANCE TO EQUINOX

- At this stage in the consultation process, a high-level understanding of the options being considered is useful
- Once the chosen options are being further developed, it will be important to gain a deeper appreciation for the impacts this will have on flexibility market and market participants' behaviour

# REMA – Zonal/Nodal Wholesale Pricing (1/2)

**Problem with national pricing:** The wholesale price does not send signals to market participants that incentivise them to operate and locate in a way that is consistent with the physical needs of the system. This leads to operational and balancing issues e.g. increased network constraint costs

**Potential solution:** Introduce more granular locational signals into wholesale electricity prices

**Option 1: Zonal Pricing - The network system is split into clearly defined zones. The boundaries are defined by major transmission constraints**

- This is an **established arrangement** in the **internal European energy market**
- Each zone has single price which assumes no network constraints within zone
- Applies on both supply and demand side, but supplier pays for energy at the same price it receives for selling energy within a single zone
- Where the price differs between two zones, the supplier pays difference between price in generation zone and price in supply zone. Cost difference is the cost of network congestion between the two zones
- Market internalises cost of network congestion and losses to some degree

## REMA – Zonal/Nodal Wholesale Pricing (2/2)

**Option 2: Nodal pricing** - Price in each location in transmission network represents **locational value of energy**. Physical network constraints (capacity, losses) **reflected in market clearing process**

- Implemented in several US states, Ontario, New Zealand, Singapore. Some expose **only supply** to locational prices; **others expose demand too**
- **'Unlikely to be practical to extend nodal pricing to the distribution network**, so it would be important to **ensure coherence between nodal pricing on the transmission network and actions taken locally, such as local flexibility markets.**
- Would require careful implementation to **safeguard inflexible, vulnerable, and fuel poor consumers from disproportionate impacts**
- Fully nodal system: wholesale market itself would resolve network congestion. **Lower compensation payments** to generators leads to consumer savings

#### RELEVANCE TO EQUINOX

- Locational wholesale prices would provide enhanced price signals to all market participants – could enable greater participation of DSR and distributed energy resources
- Plenty of challenges to overcome: concerns about liquidity and market uncertainty, distributional demand-side impacts, defining zonal boundaries, new IT systems for continuous nodal pricing calcs

# REMA – Capacity Market Reform (1/3)

## Option 1: Running specific auctions for flexibility

Each auction would procure **specific flexible characteristics** such as **response time** or **duration** and be open to all LCTs which meet agreed set of flexibility criteria

However, such an auction system would increase **complexity** of the Capacity Market and potentially **reduce liquidity**, **increasing clearing prices**

**Auction parameters** would need to be **calibrated carefully** to ensure target volumes are not too high as to under procure, or too low as to risk innovative technologies not being supported

### RELEVANCE TO EQUINOX

- If this change went ahead, it would see flexibility providers competing to provide networks with services like Equinox within a far smaller market – this could require an updated business case

## REMA – Capacity Market Reform (2/3)

### Option 2: Introducing multipliers to the clearing price for particular flexible attributes

-  Only **low carbon capacity** meeting flexibility criteria would be **eligible**
-  **Multipliers** would be applied to their **clearing price valuing flexibility characteristics** like **response time, duration** and **location**
-  The setting of multipliers would reward **specific flex needs**; the methodology for their setting would be similar to the initial development of **Capacity Market de-rating factors**.
-  There is a **risk** that if multipliers are **mis-calibrated**, outcomes could be **misaligned with system needs**

#### RELEVANCE TO EQUINOX

- Equinox could help uncover what the most valued flexibility characteristics are for networks and whether these can be derived from domestic heating

# REMA – Capacity Market Reform (3/3)

## Option 3: Optimised Capacity Market

Similar to option 2, but this would **directly target generators** with low carbon or new build characteristics

This would **insulate low carbon capacity assets** to participate while insulating them from directly competing with **established high carbon capacity**.

This could see an **increased price volatility** from a smaller pool

- Option 1: Low carbon new build/refurbished assets participate in separate auctions to the main capacity auction. ESO would set these up
- Option 2: Multiple clearing prices depending on capacity type

### RELEVANCE TO EQUINOX

- Less relevant to Equinox currently given the focus on generators
- Useful to keep track of which of the three options (if any) is pursued for Capacity Market reform, since each option will impact Equinox to a different degree

# REMA – Supplier Obligation

Decentralised, market-led approach placing a **legal requirement on suppliers to achieve a flexibility target** set by the government

**Precedent internationally** – 31 US states have Renewable Portfolio Standards

This approach could provide ‘**stronger investment and operational signals for flexibility, particularly for demand side and small-scale flexibility**’

But there are **risks around financing and delivery**. Capital cost is likely to increase if suppliers play a more significant role in determining the capacity mix. Wider questions around **supplier suitability** to lead in bringing forward investment in the longer term

## RELEVANCE TO EQUINOX

- BEIS is considering this as a supplementary mechanism to contribute to investment case for small-scale flex with lower upfront costs like DSR. This could impact the Equinox business case/incentive for suppliers and aggregators

# REMA – Revenue Cap and Floor

Flexibility assets would **compete** for a **guaranteed minimum revenue** (floor) from the government for each period (such as already exists in GB for interconnectors)

Guaranteed revenue would **provide certainty** to investors, while still **exposing assets to operational signals** across all the markets in which they would be expected to compete

**Maximum revenue cap** could also be introduced **to protect consumers from excessive profits**. Designed with **additional incentives** (e.g. availability payment) to ensure plants **keep responding** to operational signals **even once the cap has been reached**

## RELEVANCE TO EQUINOX

- BEIS note that ‘such a mechanism has to date been applied to medium and large assets and therefore may not be appropriate (or indeed needed if operational signals are stronger) for aggregated portfolios of smaller scale assets.’ Therefore, this mechanism is perhaps less relevant to Equinox specifically

# ENA Dispatch Interoperability and Settlement: Review of existing practices and gap analysis

**Definition:** Dispatch interoperability is “a standard set of policies and procedures to communicate and instruct a Service Provider to deliver a contracted service”

**Current state:** Range of different dispatch management and communication approaches amongst DSOs

There should be adoption of a **common API** for dispatching services. Would need to be **flexibly designed** to provide future proofing and flexibility product innovation

**Longer term:** All DSOs should move to APIs as the **primary method** of communicating dispatch requirements to Service Providers. This will allow the **greatest level of automation** and enable **operation at scale**

**Back-up options** may need to be available for dispatch communication should API platforms be **unavailable**, or **unaffordable** for smaller providers

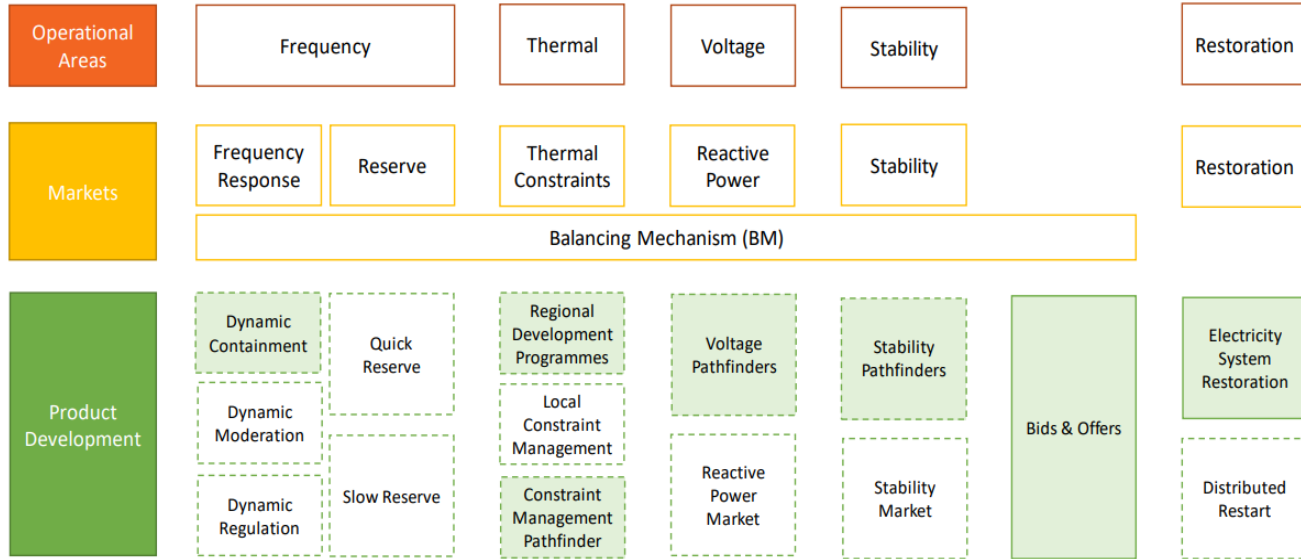

**Next step:** The group will explore existing dispatch standards at a high level to see if these could be appropriate for adoption.

**Next horizon Scan should check for results from this**

## RELEVANCE TO EQUINOX

- Equinox’s commercial arrangements must be interoperable across all DSOs and flexibility service providers
- Following the ENA’s recommendations will help to ensure that this is the case, as will tracking continued cross-sector advice coming out of the wider Open Networks [programme](#)

# NG ESO is developing many more products which could provide stacking opportunities

**RELEVANCE TO EQUINOX**

- It will be important for Equinox to keep track of which ESO products can be stacked with each other, and with DNO flexibility products
- This will enable the project to appreciate whether/when/how DNO requirements should be prioritised over ESO ones (and vice versa)

- Key - Service Procured in 2021 Product is under development
